

# Certificate

## Fire behavior of Wavin AS

Wavin AS is produced of Astolan. Astolan is a minerally reinforced polypropylen. In the case of fire polypropylen is burning. Polypropylen is a hydrocarbon, this means, it will burn like natural gas. In general, hydrocarbon will burn without producing other burning products then with natural gas.

The mineralfiller bariumsulphate is not burning. After burning we get only a white powder.

Wavin AS is classified concerning DIN 4102 as B2.
